Dear Connor and Ali:

**Re: 418-430 Aqueduct St & 650-678 Niagara St Response to Transportation Comments
Welland, ON
City File No.: OPA No. 49 & 2024-01
Region File No.: D.10.11.OPA-24-0001 & D.18.11.ZA-24-0003
Project No.: 300052233.0000**

R.J. Burnside & Associates Limited (Burnside) provides this response to the comments received from the City of Welland (City) via an email, dated April 15, 2024, and Niagara Region's (Region) Growth Strategy and Economic Development Department comments, dated March 18, 2024, on Burnside's Transportation Study, dated November 2023 (TIS).

Due to these and other comments provided by the City, the proposed site plan has been updated and is shown in Attachment 1. The updated site plan, dated August 27, 2024, is discussed below followed by the transportation-related comments and our responses.

1.0 The Updated Site Plan

A comparison of the changes between the previous and current site plan is shown in Table 1.

Table 1: Site Plan Change Summary

Element		TIS	Current	Difference
Uses	Townhouse	26	26	0
	Apartment (Building A & B)	810	542	-268
	Apartment (Building C)	360	311	-49
	Total	1,196	879	-317
	Retail	1,121	1,121	0
Parking	Resident – Townhouse	26	26	0
	Resident – Apartment	796	657	-139
	Visitor	57	0	-57
	Retail	37	40	+3
	Total	916	723	-193

The changes to the site plan and their impact on the conclusions and recommendations of the TIS are discussed below.

1.1 Traffic and Parking Review

1.1.1 Traffic Operations

The current site plan proposes 317 fewer apartments compared to the site plan examined in the TIS. This is estimated to generate 74 fewer trips in the weekday a.m. peak hour and 88 fewer trips in the weekday p.m. peak hour, after accounting for the 15% non-vehicle trip reduction. This reduction in traffic will not change the traffic operations analysis conclusions and recommendations contained in the TIS.

1.2 Parking and Loading

1.2.1 Vehicular Parking

Parking was reviewed for the updated site plan based on the City's Zoning By-law 2017-117 (ZBL). The updated parking analysis is summarized in Table 2.

Table 2: Vehicle Parking Requirements

Use	ZBL Use	Size (units or sqm)	Parking Rate	Required Spaces	Supply	Deficit / Surplus		
Townhouse	Townhouse Dwelling	26	1 / unit	26	26			
Apartment (Building A & B)	Apartment Dwelling (unit < 50 sqm)	250	0.3 / unit	367	657	+48		
	Apartment Dwelling	292	1 / unit					
Apartment (Building C)	Apartment Dwelling (unit < 50 sqm)	98	0.3 / unit	242				
	Apartment Dwelling	213	1 / unit					
Residential Subtotal				635	683	+48		
Retail	Retail	1,121	1 / 30 sqm	37	40	+3		
Total				672	723	+51		

Note: As per the ZBL, the minimum number of spaces required is increased to the next highest whole number if the fraction is greater than or equal to 0.5.

The proposed site plan includes 51 surplus parking spaces, which exceeds the ZBL requirements. Although the previously designated visitor parking spaces are being removed, the total of 657 parking spaces in Towers A, B, and C will accommodate both residents and visitors. The specific allocation of spaces provided to visitors has not been identified, as this is not a requirement of the ZBL.

1.2.2 Accessible Parking

The ZBL requires a minimum of two barrier-free parking spaces plus one space for every additional 100 required spaces for a parking supply of 100 or more spaces, which results in a minimum requirement of eight barrier-free parking spaces. The current site plan proposes 11 barrier-free parking spaces, which exceeds the ZBL requirement.

1.2.3 Bicycle Parking

The ZBL contains bicycle parking requirements for long-term resident spaces and for short-term retail spaces. The resulting bicycle parking requirements for the development are summarized in Table 3.

Table 3: ZBL Bicycle Parking Requirements

Proposed Use	Parking Rate	Required Parking	Proposed Supply	Deficit / Surplus
Townhouse and Apartment Dwelling (879 Units)	0.25 / unit	220	393	+173
Retail (1,121 m ²)	1 per 1,000 m ²	2	2	0
Total		222	395	+173

Note: As per the ZBL, the minimum number of spaces required is increased to the next highest whole number if the fraction is greater than or equal to 0.5.

The proposed long-term spaces will exceed the ZBL requirements and short-term bicycle spaces will meet the ZBL requirements.

1.2.4 Loading

According to the ZBL, a minimum of one loading space is required in conjunction with every principal building, excluding residential buildings less than four stories high. Therefore, a minimum of three loading spaces will be required according to the ZBL. The proposed supply of loading spaces will meet the ZBL requirements.

2.0 Response to Comments

Those comments relevant to transportation have been repeated below in italics (with their respective headings) with our responses following each set of comments. Where there is no numbering system, we have numbered the comments for ease of reference.

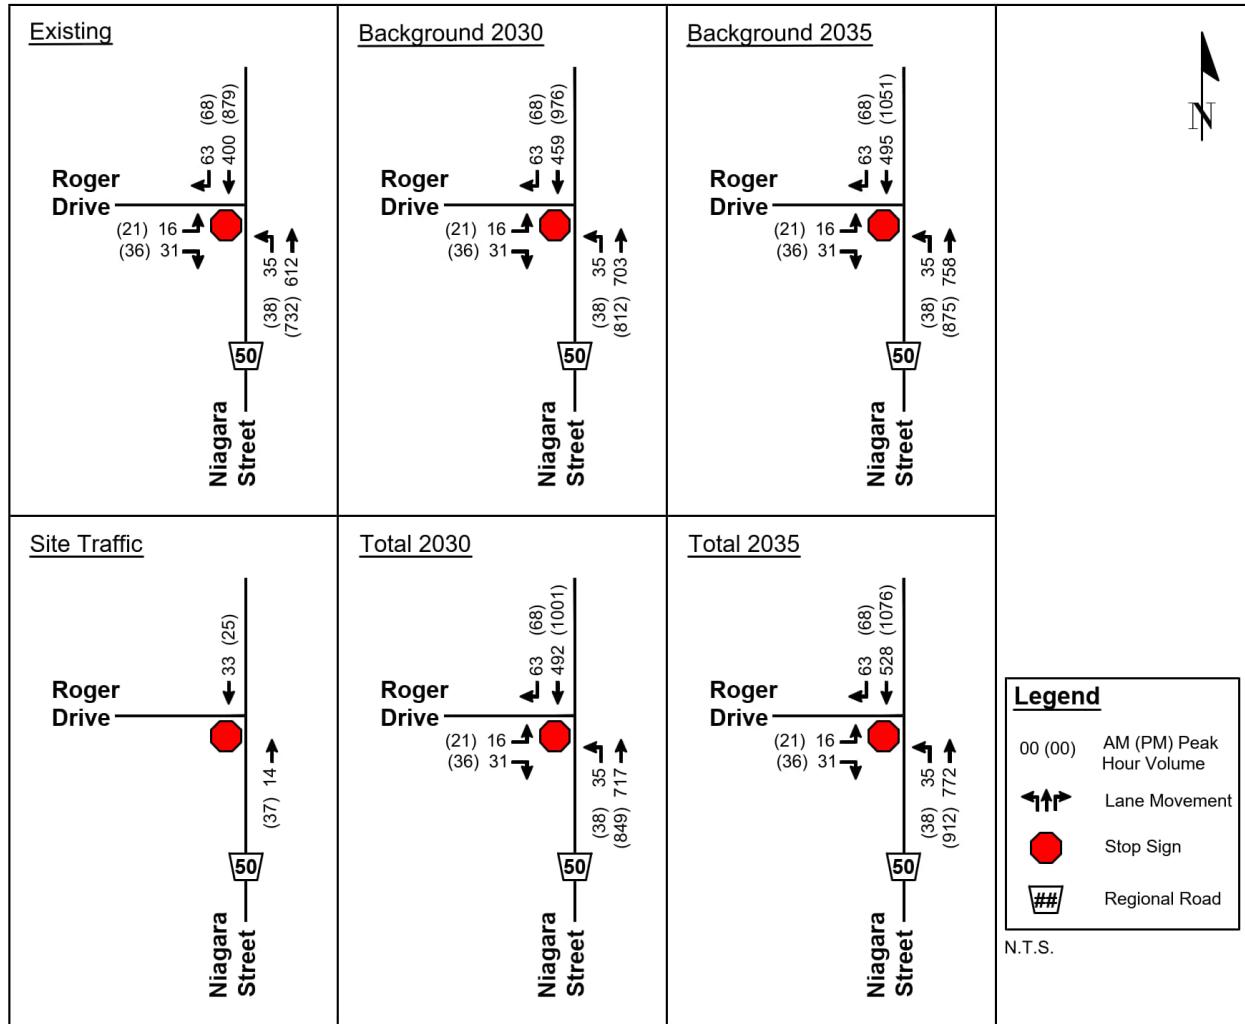

2.1 City Comments

- As a result of any revisions to TIS (due to potential changes to proposed development), please include the intersection of Roger Street/Niagara Street.*

Existing weekday a.m. and p.m. traffic counts were conducted by Pyramid Traffic Inc. on behalf of Burnside, for the weekday morning (7:00 a.m. to 9:00 a.m.) and weekday evening (4:00 p.m. to 6:00 p.m.) peak periods on May 1, 2024, at the Regional intersection of Niagara Street / Roger Drive. Traffic counts are provided in Attachment 2. Please note that traffic

corresponding to an east approach was picked up in the traffic count from a nearby driveway, which does not align with Roger Drive, so was therefore ignored for the purposes of this analysis. Existing and projected traffic volumes at this intersection for all horizon scenarios are shown in Figure 1. Projected traffic volumes were based on the site stats used in the TIS.

Figure 1: Existing and Projected Traffic Volumes at Niagara Street / Roger Drive

A synchro analysis was conducted at this intersection for all scenarios. The results are summarized in Table 4. The Synchro reports are included in Attachment 3.

Table 4: Niagara Street / Roger Drive Intersection Operations

Scenario & Movement	Existing Storage / Link Distance (m)	Weekday AM Peak Hour			Weekday PM Peak Hour		
		v/c	LOS	95th Queue (m)	v/c	LOS	95th Queue (m)
Existing Conditions							
EBLR	50+	0.08	B	2	0.13	B	4
NBL	50+	0.04	A	1	0.06	B	2
Background 2030 Conditions							
EBLR	50+	0.09	B	3	0.13	B	4
NBL	50+	0.04	A	1	0.06	B	2
Total 2030 Conditions							
EBLR	50+	0.09	B	3	0.14	B	4
NBL	50+	0.04	A	1	0.06	B	2
Background 2035 Conditions							
EBLR	50+	0.09	B	3	0.14	B	4
NBL	50+	0.04	A	1	0.06	B	2
Total 2035 Conditions							
EBLR	50+	0.09	B	3	0.14	B	4
NBL	50+	0.04	A	1	0.07	B	2

Notes: 1. The assumed saturation flow rates and peak hour factors were based on the Region's *Transportation Impact Assessment guidelines (2023)*.

During both peak hours for all scenarios, all movements are operating and will operate with excess capacity and level of service (LOS) B or better. All queues are and will be contained within their respective link distances and storage lengths. This confirms the original professional opinion of the Region and Burnside that this intersection did not need to be examined in the TIS.

2.2 Region Comments

Road Allowance

1. *The subject property has frontage along Niagara Street (Regional Road 50). This section of road meets the required road allowance as identified in the Niagara Official Plan. As such, no widening is required; however, the Region requires a daylight easement triangle at the intersection of the new access and Niagara Street. The size of the daylight will be 6 metres x 6 metres. Future site plans are to show the daylight easements to ensure there are no obstructions to the sight lines; transfer of the easement will be part of the future site plan requirements.*

The required six metre by six metre daylight easement triangles are now shown at the intersection of the new access on Niagara Street at Abby Road.

Regional Transportation Impact Study

Regional Transportation staff reviewed the Transportation study completed by RJ Burnside & Associates Limited dated November 2023 and have provided the following comments to be addressed in an updated TIS submitted with the future site plan application.

1. *The Region still requires a sightline assessment to assess the driveway location on the horizontal curve opposite to Abby Road.*

A sightline analysis was conducted at the driveway location on Niagara Street opposite Abbey Road. Based on the *Geometric Design Guide for Canadian Roads* from the Transportation Association of Canada (TAC), the minimum required intersection sight distance (ISD) is 150 m and 130 m for left turn and right turn, respectively, and the minimum required stopping sight distance (SSD) is 105 m, considering a design speed of 70 km/h. The available sightline is greater than 300 m and 250 m to the north (left turn) and south (right turn), respectively. The SSD and ISD requirements are met, as shown in the figures provided in Attachment 4.

Page 12

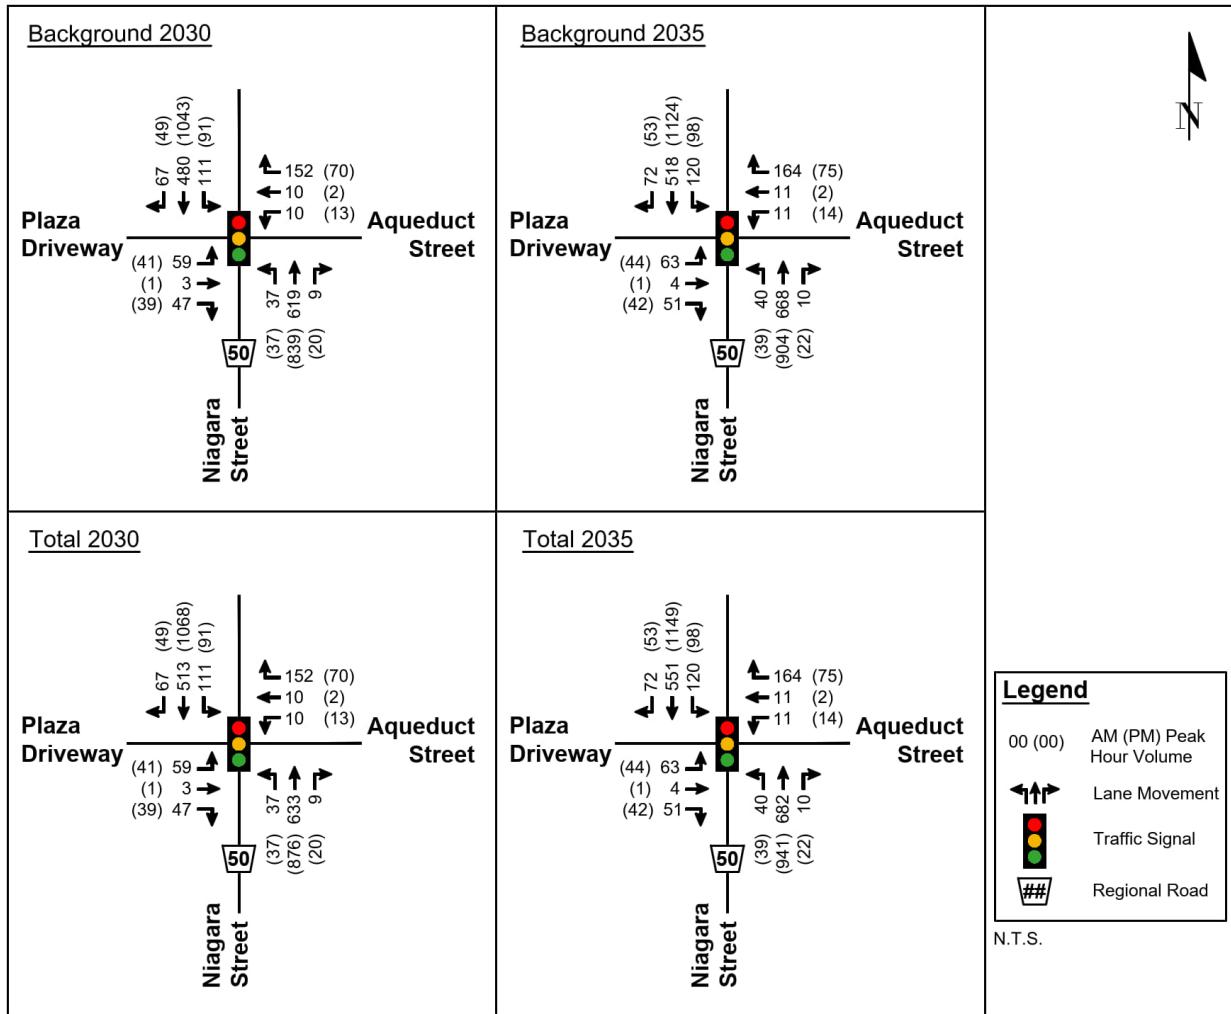

2. *Please clarify why the growth rate is applied only on the “through” movements at Niagara Street / Aqueduct Street intersection. The vehicular turning volume on this intersection is high under the existing baseline year, and it will be impacted further in the future with the addition of this development. In general, there is an overall background growth in any study area.*

We disagree that there is an overall background growth in **any** study area. Growth comes primarily from new development. The land on both sides of Aqueduct Street, south of Niagara Street, is fully built out with no known future redevelopment plans. Furthermore, the road does not provide significant external connections other than serving the existing development so cut-through traffic is not to be expected to utilize it. It is unclear where growth is expected.

3. *Avoidance of the growth rate application will impact the signal warrant result at this intersection. Please revise the traffic volume counts and the subsequent assessments accordingly.*

Please see the response to comment 2 above. Regardless, as requested growth was applied to all movements at the Niagara Street / Aqueduct Street intersection under background and total conditions. The resulting traffic volumes are shown in Figure 2. There were no changes to the projected site traffic volumes at this intersection since the TIS does not assume any site-related traffic would desire to use Aqueduct Street.

Figure 2: Future Traffic Volumes at Niagara Street / Aqueduct Street

The updated future traffic operations analyses are summarized in Table 5. The Synchro reports are included in Attachment 5.

Table 5: Niagara Street / Aqueduct Street Intersection Operations

SBTR	200+	0.30	A	33	0.53	A	70

Notes: 1. Signal timing plans were optimized.

2. The assumed saturation flow rates and peak hour factors were based on the Region's *Transportation Impact Assessment guidelines (2023)*.

During both peak hours, all movements will operate with excess capacity and LOS D or better. All queues are and will be contained within their respective link distances and storage lengths.

The conclusions and recommendations of the TIS remain the same for this intersection.

An updated signal warrant analysis was also conducted for this intersection with the requested adjustments to growth. The signal warrant analysis was based on the methodology contained in the *Ontario Traffic Manual Book 12*, published by the Ministry of Transportation. The results are summarized in Table 6. Detailed analyses are provided in Attachment 5.

Table 6: Niagara Street / Aqueduct Street Signal Warrant Analysis

Condition	Justification	Justification 1 Minimum Vehicular Volume ¹		Justification 2 Delay to Cross Traffic ¹		Justification 3 Combination ²	
		1A	1B	2A	2B	3A	3B
Background 2030	Compliance	107%	66%	95%	45%	66%	45%
	Justified	No		No		No	
Total 2030	Compliance	110%	66%	98%	45%	66%	45%
	Justified	No		No		No	
Background 2035	Compliance	115%	71%	102%	48%	71%	48%
	Justified	No		No		No	
Total 2035	Compliance	118%	71%	105%	48%	71%	48%
	Justified	No		No		No	

Notes: 1. Justification 1A and 2A are total intersection volumes while 1B and 2B are crossing (of the main road) volumes.

2. Justification 3A is justification 1, while 3B is justification 2.

For each justification, the lower percentage governs the warrant. A signal can be warranted by just one of the justifications, provided it meets the threshold for both subcategories. The threshold required for existing volumes is 100% for Justification 1 and 2, and 80% for Justification 3. The threshold required for each justification is 120% for projected volumes. Therefore, a traffic signal continues to not be warranted under future conditions at this intersection. The requested changes to growth do not affect the conclusions of the analysis.

The conclusions and recommendations of the TIS remain the same for this intersection.

Page 15-17

4. Under Section 4.1 Trip Generation, please clarify on how it was assumed that the modal split is to be 15%. The Region has concerns that this assumption is relatively high compared to the travel modal split found in the 2016 Transportation Tomorrow Survey. This will underestimate the impact of the trips generated from this development and ultimately impact the capacity analysis for the future scenarios.

A review of the 2016 *Transportation Tomorrow Survey* (TTS) results published by the Data Management Group at the University of Toronto Transportation Research Institute indicate that 17% of trips made by residents of Welland (TTS Planning District 58) are by transit (11%), walking (1%) or cycling (5%). According to the Region's *Transportation Master Plan*, dated October 2017, the total number of trips made by public transportation (transit) in the Region is

forecast to increase 80% from the existing modal split by 2041. This increase would result in transit going from 11% to 14%. In our opinion, a 15% non-auto mode share is therefore conservative. The site is designed to encourage many modes of travel other than the single occupant motor vehicle and the site is located close to many commercial retail locations, including being within a 10-minute walk of the Seaway Mall where there is a bus hub. This modal split is also consistent with other approved applications in the area (i.e., Seaway Mall). To be conservative, no reductions for pass-by trips or internal interaction trips were applied for the retail uses.

Page 24-28 Access's clear throat assessment

5. *Under Section 6 Traffic Operation Analysis, Table 8 and Table 11 provide the capacity analysis and the queue assessment for the South Driveway and North Driveway respectively. As per the 95% queue length shown, the generated traffic from the development is well accommodated within the clear throat length recommended in the site plan (Existing Storage / Link Distance). As per the analysis, it is proven that one driveway will suffice this development, and the generated queue can be accommodated within one access with a clear throat length of 30 metres.*

Acknowledged. However, two driveways will lessen the impact of each driveway and provide better connectivity for the site without undue impact to Niagara Street.

Appendices B-F (Detail Synchro Reports)

6. *The queue reports mentioned under Section 6 Traffic Operation Analysis are not attached to the appendices. Please attach in the resubmission for the Region's review.*

The 95th percentile queues were shown in the included Synchro reports that were provided in Appendices B to F.

7. *The saturation flow rate used for the Synchro analysis are higher than the values specified in the Transportation Impact Assessment guidelines (2023). Additionally, the peak hour factor was not consistent throughout the intersections in the study area and higher in the intersection of Niagara Street and Woodlawn Road. This will result in overestimating the existing and the background traffic conditions. Please revise capacity analysis using the rates highlighted in Table 1 of the TIA guidelines and use a peak hour factor of 0.92.*
8. *The comment above is applicable on all the scenarios provided.*

The peak hour factor (PHF) that was assumed in the TIS was based on existing conditions at each existing intersection and the Synchro default of 0.92 at the proposed driveways as shown in the Synchro reports. The assumed ideal saturation flow rate (ISFR) as shown in the provided Synchro reports was the Synchro default of 1,900. HCM7 recommends that existing PHF be used in this type of analysis since it is more representative of actual conditions. HCM7 also notes that as traffic volumes increase both the PHF and the ISFR are expected to also increase.

It is our opinion that the Region's guidelines are underestimating capacity and that the analysis in the TIS is consistent with HCM7 calibration guidance that will be a more accurate predictor of future conditions.

Should you require any clarification on the above, please contact either of the undersigned.

Yours truly,

R.J. Burnside & Associates Limited

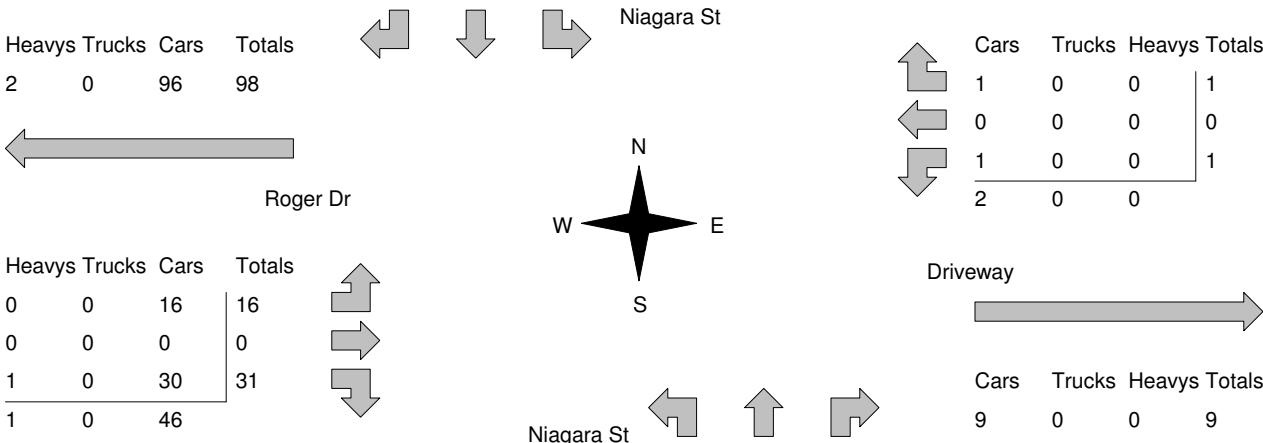

Rebecca Rust.

Input Sheet

Main Road Niagara
Minor Road Aqueduct

Direction of Main Road North / South

Date: Total 2030

No. of Lanes on Main 2 or more

T-Intersection No

Operating Environment Urban

Scenario Forecasted Traffic Volumes (Existing Intersection)

Analysis Sheet

Justification 1: Minimum Vehicle Volumes

Justification	Guidance Approach Lanes				Total	Section Percent
	1 Lanes		2 or More Lanes			
Flow Condition	FREE FLOW	RESTR. FLOW	FREE FLOW	RESTR. FLOW		
1A (All Approach Lanes)	480	720	600	900		
				X		
COMPLIANCE %					990	110%
1B (Minor Street Both Approaches)	120	170	120	170		
				X		
COMPLIANCE %					112	66%
Signal Justification 1:						

Justification 2: Delay to Cross Traffic

Justification	Guidance Approach Lanes				Total	Section Percent
	1 lanes		2 or More lanes			
Flow Condition	FREE FLOW	RESTR. FLOW	FREE FLOW	RESTR. FLOW		
2A (Major Street Both Approaches)	480	720	600	900		
				X		
COMPLIANCE %					878	98%
2B (Traffic Crossing Major Street)	50	75	50	75		
				X		
COMPLIANCE %					34	45%
Signal Justification 2:						

Justification 3: Combination (Justification 1 and 2)

Justification Satisfied 80% or More	
Justification 1	Minimum Vehicular Volume
Justification 2	Delay Cross Traffic

Results Sheet

	Justification	Compliance	Minimum Target	Signal Justified?	
				YES	NO
1. Minimum Vehicular Volume	A. Total Volume	110%	120%		NO
	B. Crossing Volume	66%			NO
2. Delay to Cross Traffic	A. Main Road	98%	120%		NO
	B. Crossing Road	45%			NO
3. Combination	A. Justification 1	66%	120%		NO
	B. Justification 2	45%			NO
